

ABSTRACT

A manual pull action clamp is disclosed. The manual pull action clamp includes a base and a handle including a first and second portion. The handle is pivotally connected to the base. The clamp further includes a pin arranged between the first and second portions of the handle. The clamp also has a bracket secured to the pin. The clamp also includes a spring arranged between the handle and the pin. The clamp is such that it is capable of one-handed operation and of holding various forces depending on the design of the clamp and the clamping environment.
